

ECG Contest

ECG, October 2015

ECG de octubre de 2015

Óscar Cano

Unidad de Arritmias, Área de Enfermedades Cardiovasculares, Hospital Universitari i Politècnic La Fe, Valencia, Spain

The patient was a 73-year-old man who had undergone implantation of a dual-chamber pacemaker in January 2014 to treat a Mobitz II atrioventricular block. The routine follow-up studies carried out in the cardiac pacing unit revealed proper functioning of the device. During a scheduled visit in April 2015, the patient underwent an electrocardiogram, the results of which are shown in the [Figure](#). The rhythm strip in the lower part of the tracing (lead II) indicates his spontaneous rhythm (first four QRS complexes) and the point of onset of the effect of a magnet placed over the pacemaker generator (from the fifth QRS complex on). Is the pacemaker functioning properly?

Figure.

Suggest a solution to this ECG Contest at <http://www.revespcardiol.org/es/electroreto/68/10> (only Spanish). The answer will be published in the next issue (November 2015). #RetoECG.
